#### Nota Bene

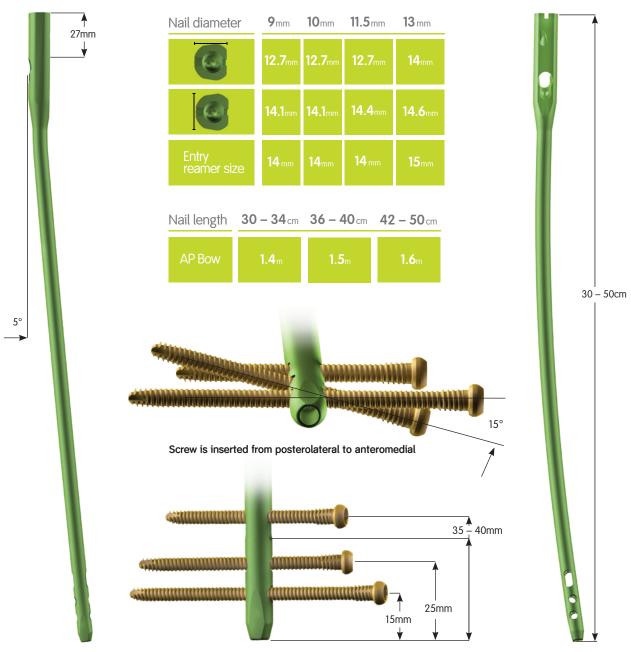

The following technique is for informational and educational purposes only. It is not intended to serve as medical advice. It is the responsibility of treating physicians to determine and utilize the appropriate products and techniques, according to their own clinical judgment, for each of their patients. For more information on the product, including its Indications for Use, contraindications, cleaning, sterilization and product safety information, please refer to the product label and the Instructions for Use (IFU) for the product.

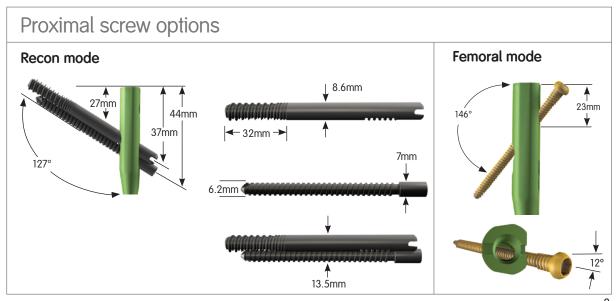

# Introduction

TRIGEN META-TAN Nails contain holes/slots proximally to accept screws that thread into the femoral head for compression and rotational stability.

# TRIGEN° META-TAN° Nail Specifications

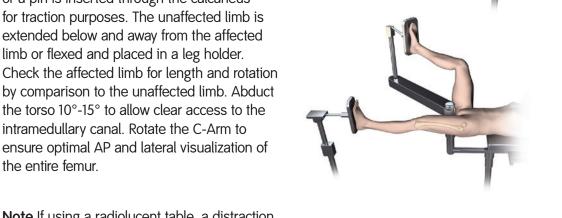

# Surgical technique

# Patient positioning

Place the patient in the supine or lateral decubitus position on a fracture table. The foot of the affected limb is placed in a foot holder or a pin is inserted through the calcaneus for traction purposes. The unaffected limb is extended below and away from the affected limb or flexed and placed in a leg holder. Check the affected limb for length and rotation by comparison to the unaffected limb. Abduct the torso 10°-15° to allow clear access to the intramedullary canal. Rotate the C-Arm to ensure optimal AP and lateral visualization of

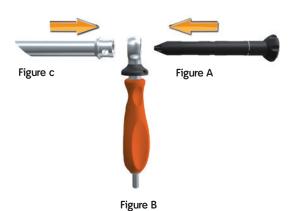

Note If using a radiolucent table, a distraction device may be helpful in reducing the fracture.

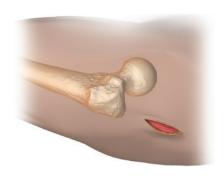

# Opening the proximal femur

# Incision and entry point

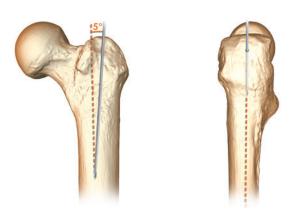

Assemble the Honeycomb (71674075, Figure A), Entry Portal Handle (71674092, Figure B) and Entry Portal Tube (71674060, Figure C). The pieces will lock in place securely at either 0 or 180.

A longitudinal incision is made proximal to the greater trochanter. Carry the incision through to the fascia and palpate the tip of the greater trochanter.

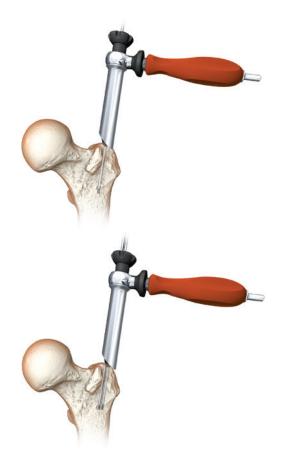

The optimal entry point for the TRIGEN° META-TAN° nail is located on the medial face of the greater trochanter, 5° from the anatomical axis in the AP and in-line with the intramedullary canal in the lateral view.

## Entry portal acquisition

Insert the Entry Portal Instrumentation through the incision down to bone. Attach a 3.2mm Guide Pin (71631436) to power via the Mini Connector (71631186) and insert 2 – 3cm into the trochanteric region. Avoid over-insertion of the Guide Pin as this can establish a false trajectory and lead to fracture malalignment. Confirm Guide Pin placement in the AP and lateral planes.

**Note** In the instance of suboptimal Guide Pin placement, rotate the Honeycomb within the Entry Portal Tube to the desired location and insert another 3.2mm Guide Pin.

Following Guide Pin placement, remove the Honeycomb from the Entry Portal Tube along with any additionally inserted Guide Pins. Insert the 12.5mm Entry Reamer (71631116) into the 14mm or 15mm Channel Reamer (71631039 or 71631445) until it clicks and attach to power. Advance the assembly through the Entry Portal Instrumentation 2 – 3cm into the trochanteric region. Evaluate reamer position before proceeding.

**Note** The 14mm Channel Reamer is used with the 9mm, 10mm and 11.5mm META-TAN° Nail. The 15mm Channel Reamer is used with the 13mm META-TAN Nail.

Adjust the trajectory of the reamer assembly if desired and advance to the positive stop on the Entry Portal Tube. The reamer will stop just below the level of the lesser trochanter. If the Entry Portal Instrumentation is not used, the Channel Reamer must still be advanced to the same point. Confirm the reamer assembly's final position in both the AP and lateral planes. Detach and remove the 12.5mm Entry Reamer from the 14mm or 15mm Channel Reamer.

**Note** The Channel Reamer and Entry Portal Instrumentation will serve as a soft tissue protector.

## Alternative Technique: Entry Portal Acquisition

Attach the T-Handle (71674076 or 71674576) to the Cannulated Awl (71674000) and insert the 3.2mm Trocar (71674074) into the back of the assembly. Introduce the awl into the proximal femur at the designated entry point until it is below the level of the lesser trochanter. Remove the 3.2mm Trocar and pass a 3.0mm Ball Tip Guide Rod (71631626) into the back of the T-Handle. Remove the awl from the proximal femur.

The region of the proximal femur extending to the lesser trochanter must be enlarged to 14mm in order to accommodate the proximal geometry of a 9mm, 10mm, and 11.5mm META-TAN° Nail. The 13mm nail requires the proximal femur to be enlarged to 15mm.

**Note** Intramedullary reamers should be used to prepare the proximal femur if the 14mm or 15mm Channel Reamer is not used\*.

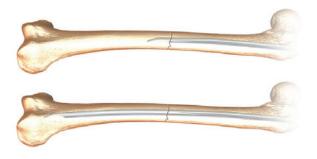

# Intramedullary reaming

## Fracture reduction

Insert the back end of the 3.0mm Ball Tip Guide Rod (71631626) into the front end of the Gripper (71674080) and gently close the trigger grip. Connect the Reducer and Reducer Connector (71674077) so that the words "Slot Orientation" are in line with the opening at the tip. Complete the Reducer assembly by connecting it to the T-Handle (71674076 or 71674576).

Introduce the Reducer into the intramedullary canal through the Channel Reamer and Entry Portal Instrumentation. Care should be taken to maintain fracture reduction. Pass the ball tip guide rod through the back of the T-Handle and insert to the desired depth using the Reducer's curved tip to avoid any areas of comminution. The guide rod should be center-center in the AP and lateral views.

Once the guide rod is in position, detach the Gripper and remove the Reducer from the intramedullary canal. Slide the Obturator (71674078) into the back of the T-Handle during extraction in order to maintain guide rod position within the canal.

## Implant measurement

After Reducer removal, re-confirm guide rod position in the distal femur. Advance the Ruler (71674079) over the guide rod through the Channel Reamer and Entry Portal Instrumentation to the desired depth. The bottom of the Ruler's metal tip denotes the driving end of the nail. Confirm the position of the Ruler's metal tip under flouroscopy.

**Note** Fractures should be treated with the longest nail possible in order to reduce the likelihood of stress risers.

Confirm guide rod position in the window at the top of the Ruler as shown in order to ensure accurate implant measurement. Push down on the top of the Ruler until contact is made with the guide rod. Implant length is read from the exposed calibrations near the thumbwheel on the Ruler.

**Note** Resistance on the Ruler may be adjusted by tightening or loosening the thumbwheel.

# Preparing the canal

Beginning with the 9.0mm End Cutting Reamer Head (71118231) and Flexible Reamer Shaft (71118200), ream the intramedullary canal sequentially in half millimeter increments to a size 1-1.5mm larger than the selected nail diameter\*.

Ensure guide rod position during reaming by inserting the Obturator into the back of the reamer unit during retraction. Continue to confirm guide rod position throughout reaming. Periodically move the reamer back and forth in the canal to clear debris from the cutting flutes.

**Note** The Channel Reamers will not accommodate reamer heads larger than 12.5mm.

# Nail assembly

Attach the Drill Guide (71631451) to the nail with the Guide Bolt (71631024) and tighten with the Guide Bolt Wrench (71631140) and T-Handle. The nail can only be attached to the Drill Guide in one way.

# Verifying targeting accuracy

- Femoral locking mode: Insert a 9.0mm Drill Sleeve (71631152) and 4.0mm Drill Sleeve (71674083) into the Drill Guide. Pass a 4.0mm Long Pilot Drill (71631110)\* through the drill sleeves and nail.
- 2. Integrated screw mode: Attach the Drill Guide Drop (71631452) to the Drill Guide to verify targeting accuracy. Insert the Lag Screw Drill Sleeve (71631418) into the Drill Guide Drop. Pass the Lag Screw Drill (71631432) through the Lag Screw Drill Sleeve and nail.

An incorrectly attached nail will not target. With targeting accuracy confirmed, remove the drop and any drill sleeves.

### Insertion

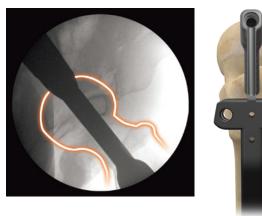

Begin insertion with the Drill Guide in the AP plane. As the nail taper reaches the isthmus of the canal, rotate the handle to the lateral position and continue with insertion.

**Note** Do not definitively seat the nail until femoral neck anteversion has been determined. Further insertion of the nail may be required to adequately seat the implant.

## Nail anteversion

With the C-Arm in the lateral position, rotate the Drill Guide until it transects the nail and is center-center in the femoral neck and head.

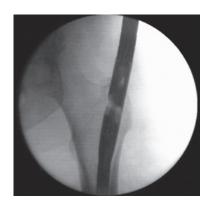

# Insertion depth

## Proximal

Insert the nail until its driving end is at or below the top of the greater trochanter. Each gauge on the insertion barrel represents a 10mm depth interval.

# Proximal locking

# Standard femoral locking

Insert the 4.0mm Trocar Drill Sleeve (71631026) into a 9.0mm Drill Sleeve (71631152). Make a small incision at the site of screw entry and insert the sleeve assembly through the hole on the drill guide and down to bone. Attach the 4.0mm Long Pilot Drill\* to power via the Mini Connector, remove the trocar from the drill sleeve assembly and drill both cortices.

Measure for screw length using either the calibrations on the 4.0mm Long Pilot Drill or by removing the Drill Sleeve and using the Screw Depth Gauge (71631189).

**Note** The 4.0mm Drill Sleeve must be against the lateral cortex for accurate locking screw length measurement.

Attach the appropriate length 5.0mm locking screw to the end of the Medium Hexdriver (71631066) and insert through the 9.0mm Drill Sleeve on power until the laser etched ring on the hexdriver reaches the back of the drill sleeve. Attach the T-Handle to the hexdriver and tighten the locking screw by hand.

<sup>\* 4.0</sup>mm AO Long Drill (71631121) is interchangeable with 4.0mm Long Pilot Drill (71631110)

# Proximal (integrated screw mode)

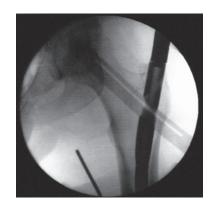

### Integrated screw mode

Attach the Alignment Tower (71631025) to the drop and slide the back end of the Alignment Arm (71631410) into the tower. The Alignment Arm represents the location of both lag and compression screws prior to insertion.

**Note:** Verify the position of the Alignment Arm under fluoroscopy with the C-arm in the AP and the emitter parallel to the top surface of the Alignment Arm.

The radiolucent slot in the center of the arm should be center-center in the femoral neck and head. This represents the central axis of the Integrated Interlocking Lag Screw. The compression screw sits beneath the Lag Screw in the Integrated Screw formation. Definitively seat the nail using the Slotted Hammer. Remove the Impactor from the Drill Guide Handle and the 3.0mm Ball Tip Guide Rod from the intramedullary canal if used.

#### **Distal**

Verify center-center placement of the nail in the distal femoral metaphysis in both the AP and lateral planes.

Note Remove the 3.0mm Ball Tip Guide Rod.

### Lag Screw Drill Sleeve insertion

Make an incision at the site of Lag Screw entry and insert the Lag Screw Drill Sleeve (71631418) into the Drill Guide Drop until it locks.

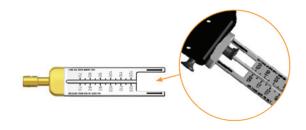

Insert the Guide Pin sleeve (71631426) and advance the 3.2mm Guide Pin into the femoral head. A new Guide Pin is recommended for this step in the technique. Confirm Guide Pin position in both the AP and lateral planes. The Guide Pin should be center-center in both views with a Tip-Apex Distance of less than 25mm\*.

### Lag Screw measurement

Slide the Lag Screw Length Gauge (71674558) under the 3.2mm Guide Pin to the back of the Lag Screw drill sleeve. Lag Screw length is taken at the end of the Guide Pin.

<sup>\*</sup>The Value of the Tip-Apex distance in predicting failure of fixation of peritrochanteric fractures of the hip. MR Baumgaertner, SL Curtin, DM Lindskog and JM Keggi. The Journal of Bone and Joint Surgery of America, 77: pp.1058-1064, 1995.

# Integrated screw insertion

Confirm Guide Pin position. Attach the Compression Screw Starter Drill (71631448) to power and insert into the Lag Screw Drill Sleeve beneath the 3.2mm Guide Pin. Advance the starter drill under power until it abuts with the back end of the Lag Screw Drill Sleeve. Remove the Compression Screw Starter Drill.

Attach the Compression Screw Drill (71631428) to power and insert through the Lag Screw Drill Sleeve into the hole created by the starter drill. Advance the compression screw drill under fluoroscopy to a depth 5mm less than the measurement taken from the guide pin. The markings on the Compression Screw Drill are read off the back of the Lag Screw Drill Sleeve.

Remove the Compression Screw
Drill and manually insert the Anti-Rotation
Bar (71631434) into the same hole. If the
Anti-Rotation Bar meets with resistance
upon insertion, remove it and re-drill with the
Compression Screw Drill.

Confirm Guide Pin position and remove the Guide Pin Sleeve. Attach the Lag Screw Drill to power and insert into the Lag Screw Drill Sleeve over the 3.2mm Guide Pin. Drill to the depth measured for the Lag Screw. The calibrations are read off the back of the drill sleeve. Confirm the Lag Screw Drill tip position under fluoroscopy.

**Note** In the instance of hard bone, it may be necessary to use the Lag Screw Tap (71631450) prior to Lag Screw insertion.

# Integrated screw insertion: no compression

Select a Lag Screw equal in length to the drilled depth.

**Example** Drilling depth 100mm

Screw length 100mm

Align the back end of the appropriate length Interlocking Lag Screw with the Lag Screwdriver. Thread the retaining rod into the Lag Screw and tighten. Insert the assembly into the Lag Screw Drill Sleeve over the 3.2mm Guide Pin.

Advance the Lag Screw manually until the "Omm" mark on the Lag Screwdriver is flush with the back of the Lag Screw Drill Sleeve and the T-Handle is perpendicular to the Drill Guide Drop. The groove on the undersurface of the Lag Screwdriver must be oriented towards the patient's feet in order to remove the Anti-Rotation Bar.

Remove the Anti-Rotation Bar and attach the compression screw that was packaged with the Lag Screw to the Compression Screw Hexdriver (71631444). Attach the T-Handle to the screw hexdriver and insert the assembly into the Lag Screw Drill Sleeve beneath the Lag Screwdriver. Advance the compression screw until the blue line on the hexdriver is flush with the back of the Lag Screw Drill Sleeve.

# Integrated screw insertion: with compression

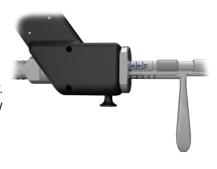

Select a Lag Screw equal in length to the drilled depth minus the desired amount of compression.

Example Drilling depth 100mm

Compression 5mm Screw length 95mm

Align the back end of the appropriate length Integrated Interlocking Lag Screw with the Lag Screw Driver. Thread the Retaining Rod into the Lag Screw and tighten. Insert the assembly into the Lag Screw Drill Sleeve over the 3.2mm Guide Pin.

If compression is desired, advance the Lag Screw manually until the "5mm" or "10mm" mark on the Lag Screw Driver is flush with the back of the Lag Screw Drill Sleeve. At final seating, the handle must be perpendicular to the drill guide assembly. The groove on the under-surface of the Lag Screw Driver must be oriented towards the patient's feet in order to remove the Anti-Rotation Bar. Release any traction on the affected limb to allow for fracture compression.

Remove the Anti-Rotation Bar and attach the compression screw that was packaged with the Lag Screw to the Compression Screw Hexdriver. Attach the T-Handle to the screw hexdriver and insert the assembly into the Lag Screw Drill Sleeve beneath the Lag Screw Driver. Advance the compression screw until the blue line on the hexdriver is flush with the back of the Lag Screw Drill Sleeve.

Compression is achieved by advancing the compression screw assembly clockwise until the "Omm" mark on the Lag Screw Driver is visible. As the head of the compression screw abuts within the nail, the gear mechanism of the Integrated Screws will compress the fracture. It is recommended to stop compression when the "Omm" mark appears at the red line.

**Note** A positive stop is located on the Compression Screw Driver to prevent compression past the red line. It is not recommended to compress past the red line.

# Integrated screw insertion: locking the Cannulated Set Screw (Optional)

The Integrated Screws are incapable of excessive medial migration and/or rotation within the nail, but can still slide to allow postoperative compression. To facilitate sliding insert the Set Screw until it stops and back it out a 1/4 turn.

The Integrated Screws can be locked if post operative sliding is undesirable. Full engagement of the Set Screw with the Lag Screw converts the construct into a fixed angle device.

To lock the Set Screw, remove the Drill Guide Handle and Guide Bolt. Choose a Set Screw and attach it to the Compression Screw Driver or Medium Hexdriver. Attach the Compression Screw Driver to the T-Handle. Turn clockwise to engage the Set Screw with the Integrated Lag Screw. The Set Screws also act as 0mm, 5mm, and 10mm Nail Caps (See below).

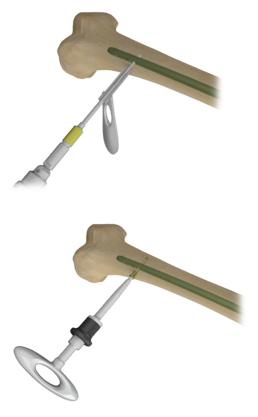

# Nail Cap insertion without Set Screw (optional)

The standard TRIGEN° Nail Caps can also be inserted if the standard proximal femoral locking option is used or if a Nail Cap is desired without a Set Screw in the proximal integrated screw locking option. The Set Screws cannot be used if the standard proximal locking option is chosen.

## Distal locking

Distal locking is performed in the lateral plane using a free-hand technique. Reconfirm fracture reduction and align the C-Arm over the desired locking hole. Obtain a "perfect circle" image of the locking hole and use a blunt object to approximate the location of the locking hole by dimpling the skin.

Make a stab incision at the site of screw entry, insert the 4.0mm Short Drill (71631123)\* down to bone, and drill both cortices. Measure for screw length using the Screw Depth Gauge. Alternatively, leave the 4.0mm Short Drill in place, insert the Screw Length Sleeve (71674085) down to bone, and read the exposed calibrations off the drill. Insert the appropriate length 5.0mm locking screw using either the Medium or Short Hexdriver (71631066 or 71631068) and T-Handle.

# Implant removal: optional

# Disengage the Cannulated Set Screw or TRIGEN° Nail Cap

Remove the Cannulated Set Screw or TRIGEN Nail Cap if implanted using the Medium Hexdriver or Compression Screw Driver and T-Handle. Attach the Medium Hexdriver or Compression Screw Driver to the T-Handle and insert into the top of the nail until it engages with the hex of the Cannulated Set Screw or TRIGEN Nail Cap. Turn counterclockwise to fully disengage.

### Integrated screws removal

Insert the Compression Screw Hexdriver into the back of the Compression Screw and engage the retaining rod. Attach the T-Handle to the back of the hexdriver and remove using counterclockwise turns of the assembly.

Under fluoroscopy, insert a 3.2mm Guide Pin into the back of the Integrated Interlocking Lag Screw. Slide the Lag Screw Driver over the Guide Pin and engage it with the back of the Lag Screw. Thread the retaining rod into the Lag Screw and remove using counterclockwise turns of the assembly.

## Implant removal: optional

### Open nail extraction technique

Remove the Nail Cap or Cannulated Set Screw if implanted and all but one of the locking screws using the Medium Hexdriver and T-Handle. Thread the Nail Extractor (71631278) into the Impactor and introduce the extraction assembly into the top of the nail. Remove the final locking screw(s) and extract the nail with a backslapping motion using the Slotted Hammer.

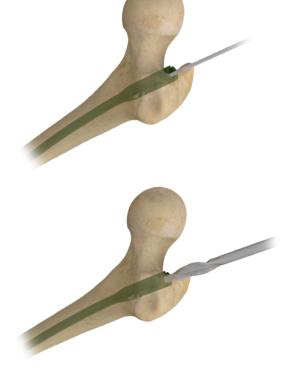

#### Percutaneous nail extraction technique

This technique assumes the absence of a Nail Cap. Attach a 3.2mm x 343mm Tip Threaded Guide Pin to power via the Mini Connector and insert into the top of the nail under fluoroscopy. This may also be performed manually.

Attach the 12.5mm Entry Reamer to power. Make a one inch incision around the Guide Pin and advance the entry reamer over the Guide Pin and into the top of the nail to remove bony in-growth. Nail extraction follows the previously described technique.

**Note:** The tip of the entry reamer is straight for approximately one inch before flaring out. It is this portion of the entry reamer that enters the top of the nail.

## Guide rod jamming technique

Advance the end of a 3.0mm Ball Tip Guide Rod (71631626) through the end of the nail. Insert a 2.0mm Ball Tip Guide Rod (71751146) driving the non-ball end through the top of the nail. With both Guide Rods in place attach the Gripper to the end of the 3.0mm Ball Tip Guide Rod and pull it back so that it wedges the ball tip against the 2.0mm Ball Tip Guide Rod. Backslap against the Gripper with the Slotted Hammer to extract the nail.

### **Guide Rods**

Cat. No.	Description
71751147	2.0mm x 600mm Ball Tip
